

R "Hello World" Program

R "Hello World" Program

A simple program to display “Hello World!” on the screen using print() function.

To understand this example, you should have the knowledge of following

R programming

topics:

R Variables and Constants

Example: Hello World Program

```
> # We can use the print() function
> print("Hello World!")
[1] "Hello World!"
> # Quotes can be suppressed in the output
> print("Hello World!", quote = FALSE)
[1] Hello World!
> # If there are more than 1 item, we can concatenate using paste()
> print(paste("How", "are", "you?"))
[1] "How are you?"
```

In this program, we have used the built-in function `print()` to print the string `Hello World!`

The quotes are printed by default. To avoid this we can pass the argument `quote = FALSE`.

If there are more than one item, we can use the `paste()` or `cat()` function to concatenate the strings together.
